# 8" STEEL-SET LOCKING CASTER

## THE NEXT GENERATION CASTER

The next generation caster builds upon the best features of the ones that came before. Double ball bearings, one set on each side of the turret, are still used so the caster rotates on the full width of the roller bearings. The whole caster, including both sides of the turret, are still completely plated for rust protection and the wide foot-print (1-3/8" contact to ground) and protected with easy to reach grease zerts (fittings) for routine maintenance are still standard features. But now, by adding new engineering to the best features of the old caster, you get a lot more for your money.

The bearing set on top of the turret is now protected by a heavyweight gasket and the bottom set is recessed under the turret. Both bearing sets are still serviced by a grease zert, but having the gasket around the top set now provides enough resistance to back flush any dirt from the bottom set. Every time you lubricate is like getting a mini-overhaul.

New STEEL-SET teeth on all 360 degrees of the turret lock into ten solid steel teeth on the wheel lock within 1-5/8" for an extremely aggressive, bi-directional hold. STEEL-SET teeth increase the number of holding surfaces by 250% and the strength of the hold by even more.

Since the STEEL-SET teeth provide such an efficient lock, the locking mechanism was also improved. The old "nautilus" type lock system requires two hands, usually a leverage devise, and it always seems to need more room than you have. By contrast, this new next generation STEEL-SET Locking Caster can be locked with one hand, using no tools and in less room than you ever thought possible. You have to buy this caster.
